

# VM BUILDING SOLUTIONS

## VMZINC & Interlocking panel

## Presentation

The VMZINC Interlocking panel system is designed for any facade to be cladded with a rainscreen system, for both new and refurbishment projects.

It involves installing interlocking panels on metal or wood framework fixed to the supporting structure (masonry or metal structure).

The panels are simply connected by the use of an interlocking groove giving the elegant appearance of a recessed joint.

## Key advantages

-  Structured design of long and flat panels made of 1 mm VMZINC,
-  Horizontal or vertical installation,
-  Interlocking attachment with concealed fastening,
-  Range of components offering a wide variety of all flashing details,
-  Certified by National European Organism.

## Areas of application

- New construction or refurbishment.
- Vertical cladding and flat ceiling.
- All types of buildings, in particular offices, public buildings and collective housing.
- Inside building (hall, entrance).
